In 1989, a low-cost version of AutoCAD, AutoCAD LT, was released. It is available as either a hard disk-based or CD-ROM-based solution. In 1998, AutoCAD R14 was released, which is now the most recent version of AutoCAD. This version introduced a new working environment, the Windows GIS, and the Internet, which are no longer available in all versions of AutoCAD. For versions older than R14, the software is still able to import vector objects (such as circles, rectangles, and lines) and convert them into raster images. In previous versions, the user was required to choose a type of screen resolution, but this restriction has been removed in the newest versions. AutoCAD LT and AutoCAD 2011 are the only versions that are still compatible with the 16-bit graphics cards used in the original versions. What are the steps to connect my desktop CAD program to the Internet? Depending on the version of AutoCAD used, there are multiple ways to connect your computer to the Internet. The newer versions of AutoCAD offer two methods of internet connection. The first method for connecting to the Internet is to run the program's Autoconf utility, which automatically detects and connects to your local area network (LAN). This is considered an automatic method. The second method of connecting to the Internet is to select the Connecting to the Internet window, which allows you to manually connect your computer to your modem. This is considered a manual method. AutoCAD 2013 features an Automatic Method for connecting to the Internet that allows users to access the Internet without the use of a modem. The Manual method is the way to connect to the Internet in older versions of AutoCAD. In a LAN, computers communicate with each other wirelessly over a local area network. This is often called "wireless" because there is no physical wire between the computers. A LAN can be formed in two ways: By using a hub or switch By using a router A hub or switch is a device that connects several devices to one another. If the hub or switch does not have enough bandwidth for the amount of devices that it is connecting, a small network of devices called a subnet is created. Each device on a subnet receives the same information from the main network, but is able to talk to each other directly without passing through the
