Viewports The Viewports are independent windows that can be opened in a separate window and "floated" over other windows. They can be used as menu bars, toolbars or static toolbars. They can be set to be always visible or floating, static or dynamic. Text, Styles and Symbols While simple text in AutoCAD is stored in its native type, which is a Tagged Image File Format (TIFF) image file, more complex types are stored in a data dictionary. The data dictionary is a portion of the file created when the drawing is saved. The data dictionary holds objects such as text style, text paragraph style and any symbology for text. In addition, it contains the equivalent to AutoCAD's "Links" (objects that hold the relevant properties of other objects) such as the "Label" objects that hold the alignment information for a text, for example. Objects In AutoCAD, objects are made up of either 2D or 3D geometry. While geometry may be stored as a DXF file, not all objects are stored as DXF. For example, objects such as blocks, splines, solids and text are created directly in AutoCAD by a graphic artist and not stored in a DXF file. A common misconception is that all geometry in a drawing is stored as a DXF file. Architecture AutoCAD Architecture is a feature in AutoCAD R14 which allows architects and engineers to create floor plans, cross-sections and perspective views. Floor plans are created by creating a rectangle on a grid that represents the size of the room and then building rooms on top of this floor plan. The floor plans are then saved as a DXF file. Cross-sections are created by drawing two perpendicular lines on a floor plan. If the floor plan is resized while the cross-section view is open, the cross-section is affected to maintain a perspective view. The perspective views can be saved as a DXF file. Project Management AutoCAD allows users to create professional quality drawings which can be used to create and maintain documentation of building projects. The Project Manager allows for the creation of tasks which can be managed and updated in a similar manner to Word and Excel. File management AutoCAD offers several options for managing the individual files of a drawing: Archiving: Files can be archived so they are no longer saved to disk. As the section is supposed to take up the entire width of the page, I want to change the colour of the end of the section so that it is easily distinguished. \begin{figure}[!h] \begin{center} \includegraphics[width=0.4\textwidth]{figures/new.png} \caption{This is a test} \end{center} \end{figure} A: If you're using pdfLaTeX, you can use the command \sectionrulefillcolor for this. (To use it, first, you have to include the setspace package to get it; then, add \sectionrulefillcolor to the preamble.) The definition of \sectionrulefillcolor is as follows: \def\sectionrulefillcolor{\leavevmode\hbox{#1}} Where #1 is a choice of two colours; red for the left side and blue for the right side, as defined in the \pdfsetsectcolor and \pdflssetsectcolor commands. If the first colour is defined as empty, it would mean that the end of a section in colour should not be drawn; in other words, it should be invisible.
