Modify and control the data transfer rate of the Compact Disc (CD). Note: I have added a new section in the config.xml file, called misc. If you want to see the contents of this new section you need to do the following: Download the new MyOpticalDrive_64 bit and unzip Open the config.xml file with a text editor You will see the following lines at the bottom of the file: Download/extract/install the latest version of 'MyOpticalDrive' from Open the config.xml file in Notepad (or any text editor) You will see that there is now a new line called misc. This is where all the settings for MyOpticalDrive 64 bit are located. Copy this line into the config.xml file. Save the config.xml file Copy the MyOpticalDrive.exe file to your desktop and start the program If you open the configuration program, you should now see some new sections in the configuration program. SpinSpeed Disable CD-Rom reads at this speed. To disable SpinSpeed, set this option to 0. To see the current value, click on the gear icon to the right of the setting. However, the plugin is extremely slow. It's the only jquery plugin that I've created and it's the only one that I use. I understand why this is, it's because this plugin adds elements to the DOM (which is really slow). The elements that it adds are formed in the plugin and added to a div tag. This div is the target of the plugin, so when I click on the div, it's clicked on as well. Is there any way to make this plugin faster? I'm at a loss here. Any help is greatly appreciated. A: It's probably more the best way to do what you're doing, but here's a speed improvement idea, that might not be what you really want: Instead of the elements that are added, add your elements to an array (or a collection) and use jQuery.index() to find them, based on a selector. This makes it much faster, because jQuery can optimize its way through the DOM much better than the actual elements. (as a side note, the jQuery.index() function

isn't actually what you want, it's pretty much a wrapper around the DOM.selectNodes()
function) model = \$user; } public function create() { \$user = \$this->model->create(); if

CD Speed can set the maximum data transfer rate of your CD-ROM drive and limit compact disk rotation speed. These settings will apply to all Windows applications that read data from CD. When you listen to your favorite music, watch movies or play games, you don't need ultra fast data transfer rate, because most multimedia formats like mpeg, divx, avi, mp3, real media, mp4 are designed to play for a long time and use low data transfer rates. When you lower data transfer rates, it lowers disk rotation speed, lowers noise level and extends your CD-ROM drive lifetime. CD Speed may help if you have problems with data read, since lower compact disk rotation speeds improve data read reliability. Also you may want to lower the speed if you use low quality CDs that may crash at high rotation speeds and seriously damage your CD-ROM drive. Give CD Speed a try to see how useful it can be in helping you to manage your optical drives! Tags: Compact Disk, Compact Disc, Optical Drive, Optical Drive
